This invention relates to novel oligonucleotide PCR primers which may be used to identify markers associated with genetic diseases and traits in dogs, in particular to disgnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention can also be used to create a genetic map of the canine genome; to generate breed-specific profiles, to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide primers for diagnosis of genetic diseases and traits in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis and

The lacZ-specific primers (AAV26433 and 26434) were used to amplify and detect the lacZ gene which had been injected into C57B1/6 mice using a recombinant adeno-associated virus (AAV) vector. This confirmed the adeno-associated virus vector can be used to deliver a therapeutic molecule to the liver of a mammal. This can be used for the expression of therapeutic molecules such as secretory proteins, antisense molecules or ribozymes, in the liver, especially to treat hepatic diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the detection of the presence or absence of chromosomal abnormalities, cach abnormality being associated with a condition in a subject and each abnormality being associated with a condition in a subject and each defined by at least one characteristic nucleic acid sequence. The method comprises: (a) obtaining a sample of nucleic acids derived from a subject which may harbour one of the chromosomal abnormalities; (b) subject which may harbour one of the chromosomal abnormalities; (b) crossing the sample to a multiplex molecular amplification (MWA) procedure, where a number of the chracteristic sequences, if present in a sufficient amount, will be amplified; (c) retrieving the product(s) characteristic of the abnormal sequences and/or absence of an amplicon characteristic of the abnormal sequences to detect the presence or absence of corresponding chromosomal abnormalities; where the MWA concepture comprises the use of at least 7 mutually distinct primers (MDP) in one single reaction mixture, each of the primers defining an end of at least one characteristic nucleic acid sequences canh being determined in their opposite ends by MDP selected from the remainder of the MDP. The methods can be used for detecting chromosomal abnormalities associated with diseases including numerous leukaemia's, lamphoma's, associated with diseases including numerous leukaemia's, lamphoma's, actionad's, adenocarcinoma's, and malignant melanoma, and malignant neoplastic conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

linkages. The oligonucleotides are used to inhibit CMV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                        Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CMV) and are able to inhibit CMV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothicate internucleotide inharges. The oligonucleotides are used to inhibit CMV infections (by in vivo or in viro contact with cells, tissues or body fluids), especially to treat or prevent CMV infections, particularly retinitis

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AA882415 to AAA68797. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAA88415. Co AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAAB3415 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA82787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                    Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                         The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA82415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in restenosis treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1. Thimers have to be a sociated state of the variable states to a mew anti-tumour associated stalylated glycoprotein antigen (TAG)-72 mouse-human chimeric antibody. The variable region has a heavy chain (VH) where VH is encoded by a DNA sequence homologous to the VHalpharAG germline gene (AAZ40701). The invention includes a method for in vivo carcinoma targeting through the administration to an animal of an anti-TAG-72 mouse-human chimeric attibody produced by specific cell lines. The antibody or a fragment are conjugated to an imaging marker or therapeutic agent, in a pharmaceutically acceptable, nontoxic, sterile carrier. The chimeric antibody binds to TAG-72 which is found on certain human tumour cells. The tissue regions containing the tumours can be detected via the markers and/or can be treated via the therapeutic agents. The method is useful for in vivo diagnosis and treatment of cancer by administering to an animal an effective amount of a composition for the in situ detection of carcinoma lesions. The method is useful for intraoperative therapy, consisting of locating the position of a tumour through the amount
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; keratinocyte derived interferon; KDI; viral infection; lymphoma; immune system related disorder; cancer; multiple sclerosis; AIDS; hepatitis; Cryptosporidium parvum infection; leukaemia; arthritis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAABA15 to AAAB6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                            New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                   This invention relates to human polynucleotide sequence AAF72333 which encodes keratinocyte derived interferon (KDI) protein AAB49774, which is a member of the interferon family. AAF72338 represents the codon optimised sequence of KDI. The human KDI gene is located on chromosome 9. The specification includes KDI related protein sequences AAB49775 - AAB49789, AAS ogiven in the specification are primer, probe and polynucleotide sequences represented by AAF72334-AAF72370 (excluding AAF72338) which are used in the isolation and characterisation of the KDI sequence of the invention. The KDI polypeptide is used to prevent, reat or ameliorate a medical condition such as immune system-related disorder, viral infection, viral exposure and cancer in a mammal. Specific disorders which can be treated by KDI include multiple sclerosis, lymphoma, acquired immune deficiency syndrome, viral hepatitis, Cryptosporidium parvum infection, chronic myelogenous behaving a substitis, diabetes and allergies
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides nucleotides encoding molecular variants of
        Isolated keratinocyte derived interferon protein and polynucleotide used to prevent, treat or ameliorate an immune system-related disorder, viral infection, viral exposure and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal,
the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a citozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a concleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                      Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MWP; matrix metalloproteinase; growth factor; reductase; scarring; oyrostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in finlammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic, cophthalmological, vulnerary, keratolytic and vincide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, actomic described wart. They can also be used for treating proliferative eye diseases such as adjabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing carring such as keloid, adhesion and hypertrophic or hypertrophic burn and contracting and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and contracting and preventing contractions.
                                                                                                                                            Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psocilasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratolytic; gene therapy; viral wart; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cyrokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, ophthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and [11] are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can slo be used for treating proliferative eye diseases such as diabetic retinopathy, vitreortinopathy, sickle cell retinopathy circuiting such as kelinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as kelinopathy and retinal detachment, and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                            Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic; retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis, actinic keratosis; squamous cell carcinoma; seborrheic wart; vitreoretinopathy; scar;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is keloid, adhesion and hypertrophic or hypertrophic burn to AAH62099 represent sequences used in the

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, captualmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as postiasis, atopic dermatiis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn companies and the contracting and preventing companies and contracting and preventing contracting and preventing contracting contracting contracting contracting contractions and contracting and preventing contracting contrac
Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.8%; Score 14.2; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a inflammation, neares RNA encoding a cytchine involved in inflammation, matrix metalloproteinase (MMP), cyclin, coll-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatological, cytostatic, antiebborrheic, antidiabets, anticicking, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are sell for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing

inflammation, matrix metalloproteinage (MMP), cyclin, cell-cycle dependent Kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, characological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn securities.
                                                                                                                                                                                                                                                                                                                                                                                             matrix metalloproteinase, growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cyrckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, artisicorratic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keracolytic and virucide activities, and cleaves RNA encoding ortokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keracosis.

C squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detechment, and for treating and preventing carring such as Keloid, adhesion and hypertrophic or hypertrophic burn scar. AMH57577 to AMH62099 represent sequences used in the
                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; racognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; matrix, metalloproteinase; growth factor; reductase; scarring; cytostatic; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antipsoriatic; ophthalmological; keracolytic; gene therapy; viral wart; acpor dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (WMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, or nucleic acid segment encoding (I). (I) can have antipsoriatic, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermaticis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can sloobe used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing

The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloprotainse (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, otheratological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can skin be used for treating proliferative eye diseases such as diabetic
                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, ribozyme therapy; hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MMP; antipsoriatic; dermatological; antiseborrheic; antidiabetic; virucide; antisickling; ophthalmological; keratolytic; gene therapy; viral wart; atopic dermatitis; actinic keratosis; squamous cell carcinoma; basal cell carcinoma; seborrheic wart; vitreoretinopathy; scar; sickle cell retinopathy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (I) which cleaves RNA encoding a cytckine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, dermatcological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and elaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis,
retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treathing and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 depresent sequences used in the

Synthetic.

```
The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative how significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of mucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABLB8779 to ABLB9321 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

```

The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid in a clinical sample, by contacting the nucleic acid in a clinical sample, whether one or more binding groups bound to the nucleic acid of the sample. This method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent oligonucleotide sequences used in the exemplification of the present

; 0 The present invention describes a collection of binding groups for a family of nucleic acids comprising members of relative high and relative low significance, where the binding groups are selected to be capable to identify, alone or in combination, essentially all members of the family of nucleic acids of relatively high significance. The collection of binding groups is useful for typing of nucleic acid in a clinical sample, by contacting the nucleic acid with the collection and determining whether one or more binding groups bound to the nucleic acid of the sample, rhis method is useful for determining whether the sample comprises at least a part of a member of relatively high significance of a family of nucleic acids. The collection of binding groups is useful for diagnosing the severity of a disease caused by a pathogen containing a member of a family of nucleic acids. ABL88779 to ABL89321 represent oligonucleotide sequences used in the exemplification of the present Gaps 0.8%;

Disclosure; Page 28; 105pp; English.

The invention relates to cDNA, protein sequence and genomic structure of the human cardiac isoform of myosin light chain kinase (cMLCK) and mutations in cMLCK gene that are associated with cardiac dysfunction. The invention also relates to methods for identifying agents that modulate cMLCK activity, cMLCK is useful for detecting enhanced susceptibility of a subject to cardiac dysfunction. CMLCK is useful for screening for an agent that modulates its biological activity. The method is useful for enhancing or preserving cardiac function in a subject having cardiac dysfunction, and harbouring a mutation in CMLCK allele. The method is useful for enhancing or preserving cardiac function in a subject having cardiac dysfunction as systolic dysfunction, diastolic dysfunction, cardiac hypertrophy, cardiachypeathy, coronary heart disease, myocardial infarction, or congestive heart failure, or for preserving cardiac function, or cardiac dysfunction which comprises valvular heart disease such as mitral valve disease, tricuspid valve disease, mitral insufficiency, tricuspid insufficiency, or mitral valve prolapse. The method is useful for treating cardiac dysfunction, e.g., systolic or diastolic dysfunction, coronary heart disease, cardiac hypertrophy, cardiacypathy, myocardial infarction, or congestive heart failure. The present sequence is a PCR primer used to amplify rabbit skeletal muscle

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Blakeslea trispora. The carRP gene (ACC47617) encodes a bifunctional enzyme, lycopene cyclase/phytoene synthase (ABE97464), and the carB gene (ACC47618) encodes phytoene dehydrogenase (ABE97465). The invention also encompasses plasmids for the expression of additional copies these genes, and plasmids for the expression of heterologous genes under the control of the carRP or the carB promoter. The carRP and carB genes can be overexpressed to increase production of beta-carotene in B. trispora, or to modify the beta-carotene blosynthetic pathway to create B. trispora strains able to produce other caroteneids such as lycopene. The promoters of these genes may also be used to control expression of heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to beta-carotene biosynthetic genes from the fungus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  genes such as the Streptoalloteichus hindustanus bleomycin resistance
gene (bleR) in B. trispora. Sequences ACC47619-ACC47620 represent Mucor
circinelloides carRP PCR primers used to generate a probe used in the
isolation of Blakeslea trispora DNA fragments containing both the carRP
                                                                                                                                                                                                                                                                                                                                                                                                                                      New carRP and carB genes from Blakeslea trispora, useful for increasing production of beta-carotene or other carotenoids, also related vectors

serotonin 1B receptor gene, comprising a DNA sequence having a variation in a sequence of 1749 base pairs defined in the specification, where the variation comprises A-161T. The human serotonin 1B receptor gene is useful for determining a susceptibility in a subject to at least one addictive disease, neurologic or psychiatric condition or disease. The addiction to other psychostimulants, nicotine addiction, barbiturate or sedative hypotonic addiction, anxiolytic addiction, barbiturate or receptor psychiatric condition or disease is anxiety, depression, pathological aggression, or compulsive gambling. The human serotonin 1B receptor gene is also useful for determining a therapeutic analgesia. This polynucleotide sequence represents a PCR primer of the human serotonin 1B receptor gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated variant allele of human serotonin 1B receptor gene useful for determining susceptibility to addictive, neurologic or psychiatric conditions or diseases in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Racing potential, horse; grandpaternal DNA; over-represented; breeding; grandmother; performance; progeny horse; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated variant allele of the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-representation of DNA from male grandparents of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, keratinocyte derived interferon, KDI; immune system disorder; inflammation; cancer; blood disorder; cardiovascular disorder; cerebrovascular disease; wound; neurological disease; viral infection; bacterial infection; blood vessel growth inhibition; immunomodulatory; antiinflammatory; vasctropic; haemostatic; cardiant; vulnerary; cerebroprotective, noctropic; neuroprotective; antibacterial; virucide; antiarteriosclerotic; cytostatic; quantitative PCR; QPCR; IFNa2; primer;
                                                                                                                            Determining the racing potential of a horse comprises measuring whether grandpaternal or grandmaternal DNA from the selected grandmother DNA is over-represented in the genome of the horse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human IFNa2 specific PCR primer #2 used in quantitative PCR reaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

derived interferon (VDI) protein, and the polynucleotide sequences encoding it. The gene encoding human KDI maps to chromosome 9. The novel KDI protein is a member of the interferon family. The invention also describes vectors, host cells, and recombinant methods for producing the XDI protein. The invention also discloses methods for identifying agonists and antagonists of KDI activity. An antibody that binds to the XDI protein, the KDI polypeptide sequence, and the polynucleotide sequence encoding KDI are useful in the diagnosis, prevention and treatment of disorders associated with the aberrant expression of the KDI protein, such as disorders of the immune system, inflammation, cancer, blood disorders, cardiovascular disorders, cerebrowascular diseases, botterial or viral infections and blood vessel growth inhibition. The present sequence represents a PCR primer weeks in a quantitative PCR (QPCR) reaction in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New use of irinotecan for preparation of compositions for treating cancer in subject having genome with variant allele comprising cytochrome p450, subfamily IIIA, polypeptide 5 polynucleotide, termed CYP3A5.
                                                                      New isolated antibody that binds a keratinocyte derived interferon (KDI) protein, for the diagnosis, prevention and treatment of disorders with aberrant expression of the KDI protein, such as disorders of the immune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for the use of irinotecan (I) or treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) golynucleotide (II). (I) has optostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                          potentially harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of drug resistances due to suboplimal drug dosing can be avoided. ACF62200 to ACF62751 and ABM34912 to ABM35013 represent sequences used in the
cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           irinotecan; colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; variant allele; multidrug resistance protein 1; MRP1; cytostatic; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of irinotecan or its derivative for preparation of a pharmaceutical composition for treating cancer in a subject having a genome with a variant allele comprising a multidrug resistance protein 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention describes a method for the use of irinotecan (I) or treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) golynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represents a sequence which is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                  RESULT 902
```

```
The present invention describes a method for simultaneously detecting the presence of multiple target nucleic acid molecules in a biological sample comprising: (a) isolating and enriching target nucleic acid molecules from the biological sample; (b) treating the enriched target nucleic acid molecules of schoological sample; (c) performing linear PCR on the cological sample; (c) performing linear PCR on the cological sample; (d) performing linear PCR on the cological where only a single primer is used; (d) obtaining beads coupled to an oligonucleotide molecule complementary to the complete target nucleic acid molecule complementary to the camplified target nucleic acid molecules; (e) forming a mixture by mixing the beads and the enriched linear PCR product nucleic acid molecule, the enriched linear PCR product includes the target nucleic acid molecule, the enriched linear PCR product will hybridise to the oligonucleotide confluorescence on the beads analysed; and (h) detecting a level of fluorescence on the beads, where the level of fluorescence corresponds to a level of a target nucleic acid molecule in the biological sample. The method for simultaneously detecting the presence of multiple target nucleic acid molecule in the biological sample. The method for simultaneously detecting the presence of multiple target nucleic acid molecule in the biological sample. ACR39439 to ACR39597 represent primers and probes used in the ACR340.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Simultaneously detecting the presence of multiple target nucleic acid molecules in a biological sample for optimizing risk-adapted therapy for a disorder by treating the enriched target nucleic acid molecules with

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAI gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAI gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient,
                                                                                                                                                                                                                                                                                                          Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIAl gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIAl gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; irinotecan; cancer; UGT1A1; cytostatic; topoisomerase I inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         colorectal cancer; cervical cancer; gastric cancer; lung cancer; ovarian cancer; pancreatic cancer; malignant glioma; uridine diphosphate glycosyltransferasel member Al.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human UGT1A1 variant allele sequence fragment SEQ ID NO:441.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.8%; Score 14.2; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a new composition, which comprises an isolated Latrophilin (LPH) nucleic acid. The compositions are useful for diagnosing or treating subjects at risk for or having eye disease, e.g. Primary Open-Angle Glaucoma (e.g. juvenile onset or adult onset), ocular hypertension, or elevated intraocular pressure. This sequence represents a primer associated with isolation of human latrophilin 3 (LPH3)

Use of irinotecan to treat cancer patient by determining if patient has variant alleles of UGTIAl gene, administering increased/decreased amounts of irinotecan based on increased/decreased levels of UGTIAl gene product. Disclosure; Page 58; 107pp; English

The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIAl gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAl gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

Claim 1; Page 82; 130pp; English

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating

```
0;
colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant gliona in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDRI) polymucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, elevical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pencreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistence 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or maiore preferably African or Malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance I (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates ro a novel use of irinotecan or its derivative for

that downregulates expression of a mitogen-activated protein kinase modulating expression of Mapk genes by RNA interference. Also described: (1) a method for modulating expression of Mapk genes in cells, tissue explants or crganisms by introduction of Mapk genes in cells, tissue explants or organisms by introduction of SiNA; (2) kits for in vitro or in vivo delivery of SiNA; (3) conjugates and/or complexes of SiNA; and (4) corpusted that express siNA and cells containing these vectors. Mapk siNAs have cytostatic, ancretic, antidabetic, antinflammatory.

In an idea to modulate the expression of Mapk genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I can li a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogaenomics; identification and validation; genetic engineering; pharmacogaenomics;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention describes a short interfering nucleic acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated
                                                                                                                                                                                                                                                                             Chowrira B;

Synthetic

```
have cytostatic, anorectic, antidiabetic, antiinflammatory, antiathmatic, immunosuppressive, antidiabetic, antiinflammatory, antiasthmatic, immunosuppressive, antidabeterial, antinheumatic, antiasthmatic, antipsoriatic and gastrointestinal activities. The MAPK sinks can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I septic shock, rheumatoid arthritis, psoriasis and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid (siNA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       short interfering nucleic acid, siNA, downregulation; inhibition, mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antidialmamatory; antiasthmatic; immunosuppressive; antibacterial; antirheumatic; antiarthritic; antipsoriatic; gastrointestinal; obesity; diabetes; tumour;

Synthetic.

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated protein kinase genes. WPI; 2003-689980/65.

Example 3; SEQ ID NO 358; 164pp; English.

modulating expression of MAPK genes in cells, tissue explants or organisms by introduction of siNA, (2) kits for in vitro or in vivo delivery of siNA, (3) conjugates and/or complexes of siNA, and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs have cytostatic, anciett, antidabetic, antinflammatory, antiasthmatic, immunosuppressive, antibacterial, antirheumatic, antiasthmatic, immunosuppressive, antibacterial, antirheumatic, immunosuppressive, antibacterial, antitheumatic, the MAPK siNAs antiathritic, antipsociatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity, diabetes types I and II; a wide range of tumours, and inflammatory diseases (asthma, septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening, diagnosis, target identification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence represents a MAPK siNA which is used The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for n the exemplification of the present invention.

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (WAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or coganisms by introduction of siNA; (2) kits for in vitro or in vivo coganisms by introduction of siNA; (2) kits for in vitro or in vivo cells. An expression of MAPK (2) kits for in vitro or in vivo cells. An expression and (4) and cells containing these vectors. MAPK siNAs care cytostatic, anorectic, antibacterial, antirheumatic, antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I complication and validation; genetic engineering; diagnosis; target disease). They can also be used for drug screening; diagnosis; target complification and validation; genetic engineering; pharmacogenomics; studying gene function and gene mapping (e.g. of single-nucleotide copinemaphisms). The present sequence represents a MAPK sinA which is used in the exemplification of the present invention.
                                                                                                                                         short interfering nucleic acid; siNA; downregulation; inhibition; mitogen-activated protein kinase; MAP kinase; MAPK; RNA interference; cytostatic; anorectic; antidiabetic; antiinflammatory; antiasthmatic; immunosuppressive; artibacterial; antirheumatic; antiarthritic; antiporiatic; gastrointestinal; obesity; diabetes; tumour; inflammatory disease; asthma; septic shock; rheumatoid arthritis; psoriasis; inflammatory bowel disease; drug screening; genetic engineering; pharmacogenomic; gene mapping; ss.
                                                                           Mitogen activated protein kinase sinA oligonucleotide SEQ ID NO:357.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of mitogen-activated protein kinase genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.8%; Score 14.2; DB 1; Length 19;

The present invention describes a short interfering nucleic acid (siNA) that downregulates expression of a mitogen-activated protein kinase (MAPK) genes by RNA interference. Also described: (1) a method for modulating expression of MAPK genes in cells, tissue explants or corganisms by introduction of siNA; (2) kits for in vitro or in vivo delivery of siNA; (3) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; and (4) vectors that express siNA and cells containing these vectors. MAPK siNAs can express siNA and cells containing these vectors. MAPK siNAs can explantic, immunosuppressive, antibacterial, antirheumatic, antisoriatic and gastrointestimal activities. The MAPK siNAs can be used to modulate the expression of MAPK genes, in cells, tissue explants or organisms, e.g. for treating obesity; diabetes types I cand II; a wide range of tumours, and inflammatory diseases (asthma, ceptic shock, rheumatoid arthritis, psoriasis and inflammatory bowel disease). They can also be used for drug screening; diagnosis; target containing men and validation; genetic engineering; pharmacogeneous containing men and validation; genetic engineering; pharmacogeneous containing men function and gene mapping (e.g. of single-nucleotide coplymorphisms). The present expresents a MAPK siNA which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA that downregulates the VEGF gene, (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, antidiabetic, ophthalmological, antiarthritic, antipsoriatic, nephrotropic and cytostatic, antidiabetic, ophthalmological activities. The siNA are useful for modulating (downregulating) the expression of VEGFR genes. The siNA are potentially useful for treating a wide range of angiogenesis-associated conditions, neovascular glaucoma, arthritis, psoriasis, endometriosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siNA, that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates the vascular endothelial growth

double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor receptor; VEGFR; antiangiogenic; cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; nebhrotres retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; ss.
that express siNa, and (5) single-stranded siNa with similar properties. The siRas have antianglogenic, cytostatic, antidabetic, ophthalmological, antiarthritic, antipostriatic, nephrotropic and gynaecological activities. The siNa are useful for modulating (downregulating) the expression of VEGFR genes. The siNa are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, necovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNa may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New double-stranded interfering nucleic acid, useful e.g. for treatment

nucleic acid (siMa) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a siMa that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siMa; and (5) single-stranded siMa with similar properties. The siMas have antiangiogenic, cytostatic, antidiabetic, ophthalmological, antiathritic, antipsoriatic, nephrotropic and gynaecological activities. The siMa are useful for modulating (downregulating) the expression of VEGFR genes. The siMa are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angictibroma, and polycystic kidney disease. The siMa may also be useful for diagnosis, and polycystic kidney disease. The siMa may also be useful for diagnosis, dung screening, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the exemplification of the present invention. ö double-stranded short interfering nucleic acid; short interfering nucleic acid; siNA; downregulation; vascular endothelial growth factor vegory vegory, used antidabetic; orthogonal, antiarthritic; antipsoriatic; cytostatic; antidabetic; ophlalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; and diagnosis of cancer, downregulates the vascular endothelial growth Gaps invention describes a double-stranded short interfering Human VEGFR1 short interfering nucleic acid (siNA) SEQ ID NO:188 .. 0.8%; Score 14.2; DB 1; Length 19; 14.2%; Pred.                                                                                                                                                                                            The invention relates to human keratinocyte derived interferon (KDI; ADF94966) and nucleic acids encoding it (ADF94965). The KDI gene is located on chromosome 922. The invention also relates to sequences at least 70% identical to the KDI nucleic acid and protein sequences; a polypeptide comprising an epitope-bearing portion of KDI; recombinant vectors and host cells comprising a KDI nucleic acid sequence; a method for the recombinant expression of KDI nucleic acid sequence; a method for the recombinant expression of KDI nucleic acids or proteins for treating medical conditions; a method for the diagnosis of a pathological condition or susceptibility to a pathological condition, and methods of screening for KDI binding partners. The KDI polypeptides and polynucleoides, and methods of the invention are useful for preventing, treating or ameliorating a medical condition, such as an immune-related
New isolated keratinocyte derived interferon (KDI) polypeptide, useful for preventing, treating or ameliorating a medical condition, such as an immune-related disorder, a viral infection, a viral exposure or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  disorder, cancer, or a viral infection or viral exposure. The present sequence is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; BCR; ss; siRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human BCR-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                           New double-stranded interfering nucleic acid, useful e.g. for treatme and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leuxaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leuxaemia; lymphoma; human; BCR; ss; siRNA.
                                                                                                                                       The invention relates to a novel double-stranded short interfering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human breakpoint cluster region-targeted siRNA - SEQ ID 494.

           The invention relates to a novel double-stranded short interfering mucleic acid (shNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cycostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene, function studies and gene mapping. The current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; ss; siRNA; ABL1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel double-stranded short interfering mucleic acid (siMA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homoologue 1 (BCR-ABL) gene. The siMNA of the invention demonstrates cytostatic as citivity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region—val Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human BCR-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                            short interfering nucleic acid, siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; BCR; ss; siRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel double-stranded short interfering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

The invention relates to a novel double-stranded short interfering nucleic acid (siNA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murine leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human ABL1-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  short interfering nucleic acid; siNA; breakpoint cluster region; v-abl Abelson murine leukaemia viral oncogene homologue 1; BCR-ABL; cytostatic; leukaemia; lymphoma; human; BCR; ss; siRNA.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor receptor (POGFY) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are sessembled from a sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, double-stranded sort of complexes and can be chemically synthesised, expressed from a cevetor or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA, conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or creating leukaemit of a variety of conditions. They may be used for treating leukaemia and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomerulomephritis and stroke. The siNAs are also and sidicinal solid tumours, therapeutic target identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          targeted double-stranded siNA, which is identical to the PDGFr transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interfering mucleic acid; sinA, short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human PDGFr-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel double-stranded short interfering nucleic acid (shMA) that downregulates expression of the breakpoint cluster region-v-abl Abelson murthe leukaemia viral oncogene homologue 1 (BCR-ABL) gene. The siRNA of the invention demonstrates cytostatic activity and may be useful for modulating expression of the BCR-ABL gene, as well as for treating leukaemia or lymphoma and in diagnosis, drug screening, target identification and validation, genetic engineering, gene function studies and gene mapping. The current sequence is that of the human BCR-targeted siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interference; short interference; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; therapeutic target identification; pharmacogenomics; gene function analysis; gene mapping; human; platelet derived growth factor receptor; PDGFr; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New double-stranded interfering nucleic acid, useful e.g. for treatment and diagnosis of leukemia and lymphoma, downregulates the breakpoint cluster region-Abelson (BCR-ABL) gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the sinks include short interfering RNA (sinkA, doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The sinka deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapp), or in grafts and transplants of cort the treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment as and solid tumours, restenosis, polycystic kidney disease, bronchiolitis, glomernlonephritis and stroke. The siNAs are also such in the conditions of such and solid tumours, restenosis, polycystic kidney and such as a su
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New short interfering nucleic acid, useful e.g. for treatment and diagnosis of tumors, downregulates expression of the platelet-derived growth factor receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to short interfering nucleic acids (siNA) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           downregulate expression of the human platelet-derived growth factor receptor (PDGFr) gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They

The invention describes a new antisense oligonuclectide, having a sequence comprising 8-80 bp targeted to a nucleic acid encoding cyclindependent kinase 4, specifically hybridises with the nucleic acid encoding cyclin-dependent kinase 4 and inhibits expression of cyclindependent kinase 4. The antisense oligonuclectide is useful for preparing a composition for treating diabetes, infertility or hyperproliferative disorder, e.g., cancer. This sequence represents a primer used in the isolation of DNA encoding mouse cyclin dependent kinase 4. Example 13; SEQ ID NO 13; 90pp; English.

                                                                                                                                                                                                                                                                                                                The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA in liquid determination of one or more bacterial 16S-rRNA, cample. The chip is useful for detecting one or more bacterial 16S-rRNA, derived from bacteria such as Achromobacter xylosoxidans, Acinecobacter baumannii, Actinomyces israelii, Aerococcus viridans, Aeromonas con ydrophilia, Actinomyces israelii, Aerococcus viridans, Aeromonas con ydrophilia, Actinomyces israelii, Aerococcus viridans, Aeromonas con ydrophilia, Agrobacterium radiobacter, Bacillus sp., Bacterococcus avium con control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   genotypic characterization in a provided sample and also enables identification of a bacterium even in a complex biological sample. The chip which is produced at reduced cost, enables determination of 165-rRNA in a sample with reduced experimental error and variation. The present sequence represents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                analytical chip; bacterial 16S-rRNA; genotypic characterization; probe;

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 166-rRNA in liquid sample. The chip is useful for detecting one or more bacterial 165-rRNA, derived from bacteria such as Adromobacter xylosoxidans, Acinetobacter baumannii, Actinomyces israelii, Aerococcus viridans, Aeromonas hydrophilia, Agribacterium adiobacter, Bacillus sp., Bacteroides ovatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium, Escherichia coli, Flavobacterium breve, Endina and Nealla morbillorum, Gardnerella vaginalis, Hademophilus influenzae, Hafina alvei, Kingella sp., Klebsiella oxytoca Lactobactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus catarrhalis, Mycobacterium avium, Neisseria cinerea, Nocardia sp., cohrobactrum anthropi, Pasteurella multocida, Peptostreptococcus magnus ochrobactrum anthropi, Shigella sonnei, Veillonella parvula, Veillonella pp. or Yersinia enterocolitica. The chip is useful for detecting clinically relevant bacteria. The chip enables determination of one or more different bacteria. The chip enables determination of one cannels rapid, accurate, essy and reliable identification of bacteria by genotypic characterization in a provided sample and also enables contains the complex bedieved the contains of the contains and also enables contains of the contains of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chip which is produced at reduced cost, enables determination of 16S-rRNA in a sample with reduced experimental error and variation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in a sample with reduced experimental error and variation. The present sequence represents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 analytical chip; bacterial 16S-rRNA; genotypic characterization; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
derived from bacteria such as Achromobacter xylosoxidans, Acinetobacter baumannii, Actinomyces israelii, Aerococcus viridans, Acinetobacter baumannii, Actinomyces israelii, Aerococcus viridans, Aeromonas harbinia, Agrobacterium radiobacter, Bacillus sp., Bacteroides ovatus, Campylobacter feetus, Citrobacter frendiii, Enterococcus avium nucleatum, Gemella morbilorum, Gardnerella vaginalis, Haemobhilus influenzae, Hafnia alvei, Kingella sp., Klebsiella oxytoca, Lactobacillus acidophilus influenzae, Hafnia alvei, Kingella sp., Cohrobacterium anthropi, Pasteurella multocida, Peptostreptococcus magnus, Salmonella typhi, Shigella sonnei, Veillonella parvula, Veillonella sp. ochrobacterium anthropi, Pasteurella multocida, Bectostreptococcus magnus, Salmonella typhi, Shigella sonnei, Veillonella parvula, Veillonella sp. or Versinia enterocolitica. The chip is useful for detecting clinically relevant bacteria. The chip mables determination of one or more different bacterial 165-rRNA in a liquid sample, simultaneously and enables rapid, accurate, easy and reliable identification of bacteria by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genotypic characterization in a provided sample and also enables identification of a bacterium even in a complex biological sample. The chip which is produced at reduced cost, enables determination of 16S-rRNA
                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA in liquid sample. The chip is useful for detecting one or more bacterial 16S-rRNA,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence represents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                different bacterial 16S-rRNA in liquid sample, comprising evanescent field measurement platform as solid carrier and several specific

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 165-rRNA, cample. The chip is useful for detecting one or more bacterial 165-rRNA, derived from bacteria such as Achromobacter xylosoxidans, Acinetobacter bacumini, Actinomyces israelii, Aerococcus viridans, Aeromonas hydrophilia, Agrobacterium radiobacter, Bacillus sp., Bacteroidaes con yeatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium Campylobacter fetus, Citrobacter freundii, Enterococcus avium con yeatus, Campylobacterium action, Flavobacterium breve, CC Fusobacterium nucleatum, Gemella morbillorum, Gardnerella vaginalis, Ladtobacillus acidophilus, Legionella pneumophila, Moraxella caterialis, Mycobacterium avium, Neiseeria cinera, Nocardia sp., Colrobactum anthropi, Pasteurella multocida, Peptostreptococcus magnus CC sarartalis, Mycobacterium avium, Neiseeria cinera, Nocardia sp., Sp. or Versinia enterocolitica. The chip is useful for detecting clinically relevant bacteria. The chip is useful for detecting con conce different bacteria. The chip enables determination of one or more different bacterial 165-rRNA in a liquid sample, simultaneously and cenables rapid, accurate, easy and reliable identification of bacteria by genotypic characterization in a provided sample and also enables con in a sample which is produced at reduced cost, enables determination of 165-rRNA in a sample with reduced cost, enables determination of 165-rRNA in a sample with reduced experimental error and variation. The present concerns a province remove remo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence represents a probe of the invention used as an analytical chip.

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA, carmole. The chip is useful for detecting one or more bacterial 16S-rRNA, derived from bacteria such as Achromobacter xylosoxidans, Acinetobacter baumannii, Actinomyces israelii, Aerococcus viridans, Bacrecridaes hydrophilia, Agrobacterium radiobacter, Bacillus sp., Bacterococcus avium contentum lentum, Escherichia coli, Flavobacterium breve, Eusobacterium nucleatum, Gemella morbillorum, Gardnerella vaginalis, Famenobhius influenzea, Hafnia alvei, Kingella sy, Klebsiella oxytoca catarrhalis, Mycobacterium avium, Neisseria cinerea, Nocardia sp., Cohrobactum anthropi, Basteurella multocida, Peptostreptococcus magnus cohrobactum anthropi, Pasteurella multocida, Peptostreptococcus magnus, Ochrobactum anthropi, Pasteurella sonnei, Veillonella parvula, Veillonella sp. or Yersinia enterocolitica. The chip is useful for detecting cincally relevant bacteria. The chip enables determination of one or more different bacterial 16S-rRNA in a liquid sample, simultaneously and endettypic characterization in a provided sample and also enables con in example with reduced experimental error and variation. The present sequence represents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 analytical chip; bacterial 16S-rRNA; genotypic characterization; probe;

The present invention relates to an analytical chip for simultaneous determination of one or more different bacterial 16S-rRNA in liquid sample. The chip is useful for detecting one or more bacterial 16S-rRNA, derived from bacteria such as Achromobacter xylosoxidans, Acinetobacter baumannii, Actinomyces israelii, Aerococcus viridans, Aeromonas hydrophilia, Agrobacterium radiobacter, Bacillus sp., Bacteroidasch rowatus, Campylobacter fetus, Citrobacter freundii, Enterococcus avium C. Bubacterium lentum, Gemella coli, Flavobacterium breve, Eusobacterium nucleatum, Gemella morbillorum, Gardnerella vaginalis, C. Lactobacillus acidophilus influenzae, Hafnia alvei, Kingella syn, Klebsiella oxytoca catarrhalis, Mycobacterium avium, Neisseria cinera, Nocardia sp., Cohrobactum anthropi, Pasteurella multocida, Peptostreptococcus anguns controbactum anthropi, Pasteurella multocida, Peptostreptococcus anguns controbactum anthropi, Pasteurella multocida, Peptostreptococcus anguns controbactum anthropi, Phigella sonnei, Veillonella parvula, Veillonella sp. or Yersinia enterocolitica. The chip enables determination of one or controbacterization in a liquid ample, simultaneously and contentification of a bacterium even in a loguid ample, simultaneously and contentification of a bacterium even in a complex biological sample. The chip which is produced at reduced cost, enables determination of bacteriu at complex panelum and also enables chip, which is produced experimental error and variation. The present contents a probe of the invention used as an analytical chip.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                Analytical chip useful for simultaneous determination of one or more different bacterial 16S-rRNA in liquid sample, comprising evanescent field measurement platform as solid carrier and several specific

```
The sequence originates from the chicken alpha-globin gene. It is the complement of primer (227) (AAQ24908). The selected primer is used in practice of the single primer amplification reaction (SPAR). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid sequence single primer amplification - useful for genomic variation analysis and polymorphism detection for restriction fragment
                                                                                                                                                                                                                                                                                                                           The present invention relates to human nucleic acid sequences (1, AD015739-AD015912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (1) is useful for prognosing and determining the progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAT11971-84 are antisense oligonuclectides (ONS) against human cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AAT11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity.

Antisense ONS targeting CMV DNA or RNA coding for the ISI, IE2 or DNA polymerase proteins have been shown to be effective in therapy, polymerase proteins have been shown to increase their efficacy. Modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and halogen-substituted sugar modeties at the 2' position.                                                                                                                                                                                                                                                                                                                                                                                                                                      AAQ84817 and AAQ84818 are a pair of primers for the PCR amplification of AAQ84793, a new autosomal dominant spinocerebellar ataxia type 1 (SCA 1) nucleic acid, which encodes the protein product described in AAR71111. Both the nucleic acid and the protein can be used to develop products, for the presymptomatic detection of a SCA 1 disorder. (Updated on 25-MAR-

New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, 5 contranslated region, intron/exon (I/E) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or papillomavirus. The PNAs can be used to target RNA and single stranded CC papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which single the resulting double helix or with the first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds collinar uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by processes. The present sequence targets CWN IE2 nuclear localisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma.virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant pathogen; fungus; Septoria nodorum; Septoria tritici; Fusarium; Pseudocercosporella herpotrichoides; Mycosphaerella fijienais; PCR; Mycosphaerella musicola; amplification; primer; ribosomal RNA gene; internal transcribed region; strain; capture; colourimetric assay; isolate; development; population; ss.

A novel method for the detection of plant pathogenic strains of fungi
e.g. Septoria nodorum, S.tritici, Pseudocercosporella herpotrichoides,
Wycosphaerella fijiensis, M.musicola or Fusarium spp, involves the PCR
amplification of sequences found in the internal transcribed region (ITS)
of the 185, 5.85 and 285 ribosomal RNA genes by the primers AA094359-93
and AAT05357-72. These primers are derived from the ITS sequences of
these fungi (AAT05394-105404 and AA094398) and are strain specific. The
amplification products of the reactions using these primers can be used
with the capture primers AAT05378-93 in colourimetric assays. The primers
and ITS DNAs can be used for the detection of specific fungal pathogen
                                                                                                                                                                                                                                                                                                                                                             encoding intervening transcribed sequence - used for detection of nt fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Plant pathogen; fungus; Septoria nodorum; Septoria tritici; Fusarium; Pseudocercosporella herpotrichoides; Mycosphaerella fijiensis; PCR; Mycosphaerella musicola; amplification; primer; ribosomal RNA gene; internal transcribed region; strain; capture; colourimetric assay; isolate; development; population; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding intervening transcribed sequence - used for detection of plant fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                        A novel method for the detection of plant pathogenic strains of fungiengs. Septoria nodorum, S.tritici, Pseudocercosporella herpotrichoides, Mycosphaerella fijiensis, M.musicola or Fusarium spp, involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 185, 5.85 and 285 ribosomal RNA genes by the primers AAQ94359-93 and AAT05357-72. These primers are derived from the ITS sequences of these fungi (AAT05394-T05404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ·.

The sequences given in AAT03664-73 are oligonucleotides which are used in the diagnosis of hepatitis C virus (HCV). These oligonucleotides acts as primers to amplify region of the HCV genome, pref. hypervariable regions. The amplified product is subjected hot electrophoresis under denaturing conditions. Preferably, primer MS1, MS2, MS3, MS4, MS5 or MS6 and an oligo selected from MR1, MR2 or MR1' are used as primer pairs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          L-proline-4-hydroxylase; convert; catalyse; L-proline; production; trans-4-hydroxy-L-proline; 2-ketoglutaric acid; ferrous ion; industrial scale; intermediate; manufacture; drug; food additive; primer; PCR; polymerase chain reaction; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAT47929-30 are primers used to amplify the sequence encoding the N-terminal of L-proline-4-hydroxylase (WO9291) from Dactylosporangium sp. The enzyme converts L-proline to trans-4-hydroxy-L-proline in the presence of 2-ketoglutaric acid and ferrous ions. The DNA (AAT47924) is used for the efficient production of trans-4-hydroxy-L-proline on an industrial scale for use as an intermediate in the manufacture of drugs and as a food additive
                                                                                   Oligo:nucleotide primers for amplifying hepatitis C virus cDNA - specifically the hyper:variable regions, useful for diagnosis of hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Primer for N-terminal L-proline-4-hydroxylase coding sequence.
                                                                                                                                                                                                                                                                                                                                                                   Length 20;

The products of the invention satisfy the requirements of good in-vivo stability; ability to cross cellular and nuclear membranes, and specific binding to target nucleic acid better than known oligonucleotides. (Updated on 27-AUG-2003)
                                                                                                                                                                                                                                                                                                                                                        Phosphonomonoester analogue; inhibitor; antisense; cancer; restenosis; ribozyme; diagnostic agent; detection; treatment; disease; virus; integrin; cell-cell adhesion receptor; TNF-alpha; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New oligo:nucleotide analogues contg. phospho:mono:ester bridges - for therapeutic inhibition of gene expression, e.g. in cancer or viral infection, with good specificity and in vivo stability.
                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel phosphonomonoester oligonuclectide

Claim 7; Col 13-14; 186pp; English.

```
The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65798-T66047 were used to PCR amplify the inserts from the isolated clones containing the repeat sequences. The primers AAT66009-9 wate used to amplify the respeat sequence. The primers AAT66009-9 wate used to amplify the respeat

Isolated nucleic acid specific for internal transcribed spacer of Candida krusei - can be detected by specific probe for rapid and sensitive diagnosis of systemic candidiasis.
                                    The present sequence is a primer for the PCR amplification of the Candida internal transcribed spacer 4 (ITS4), which can be used in the diagnosis systemic candidiasis. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is an universal Candida internal transcribed spacer (ITS) primer for the detection of ITS, useful to diagnose systemic Candida infection, i.e. candidiasis.
